

Instruction Set Nomenclature

Status Register (SREG)

SREG	Status Register
C	Carry Flag
Z	Zero Flag
N	Negative Flag
V	Two's complement overflow indicator
S	$N \oplus V$, for signed tests
H	Half Carry Flag
T	Transfer bit used by BLD and BST instructions
I	Global Interrupt Enable/Disable Flag

Registers and Operands

Rd:	Destination (and source) register in the Register File
Rr:	Source register in the Register File
R:	Result after instruction is executed
K:	Constant data
k:	Constant address
b:	Bit in the Register File or I/O Register (3-bit)
s:	Bit in the Status Register (3-bit)
X,Y,Z:	Indirect Address Register (X=R27:R26, Y=R29:R28, and Z=R31:R30)
A:	I/O location address
q:	Displacement for direct addressing (6-bit)

4. Instruction Set Summary.....	22
5. ADC – Add with Carry.....	30
5.1. Description.....	30
5.2. Status Register (SREG) and Boolean Formula.....	30
6. ADD – Add without Carry.....	32
6.1. Description.....	32
6.2. Status Register (SREG) and Boolean Formula.....	32
7. ADIW – Add Immediate to Word.....	33
7.1. Description.....	33
7.2. Status Register (SREG) and Boolean Formula.....	33
8. AND – Logical AND.....	35
8.1. Description.....	35
8.2. Status Register (SREG) and Boolean Formula.....	35
9. ANDI – Logical AND with Immediate.....	36
9.1. Description.....	36

9.2. Status Register (SREG) and Boolean Formula.....	36
10. ASR – Arithmetic Shift Right.....	37
10.1. Description.....	37
10.2. Status Register (SREG) and Boolean Formula.....	37
11. BCLR – Bit Clear in SREG.....	38
11.1. Description.....	38
11.2. Status Register (SREG) and Boolean Formula.....	38
12. BLD – Bit Load from the T Flag in SREG to a Bit in Register.....	39
12.1. Description.....	39
12.2. Status Register (SREG) and Boolean Formula.....	39
13. BRBC – Branch if Bit in SREG is Cleared.....	40
13.1. Description.....	40
13.2. Status Register (SREG) and Boolean Formula.....	40
14. BRBS – Branch if Bit in SREG is Set.....	41
14.1. Description.....	41
14.2. Status Register (SREG) and Boolean Formula.....	41
15. BRCC – Branch if Carry Cleared.....	42
15.1. Description.....	42
15.2. Status Register (SREG) and Boolean Formula.....	42
16. BRCS – Branch if Carry Set.....	43
16.1. Description.....	43
16.2. Status Register (SREG) and Boolean Formula.....	43
17. BREAK – Break.....	44
17.1. Description.....	44
17.2. Status Register (SREG) and Boolean Formula.....	44
18. BREQ – Branch if Equal.....	45
18.1. Description.....	45
18.2. Status Register (SREG) and Boolean Formula.....	45
19. BRGE – Branch if Greater or Equal (Signed).....	46
19.1. Description.....	46
19.2. Status Register (SREG) and Boolean Formula.....	46
20. BRHC – Branch if Half Carry Flag is Cleared.....	47
20.1. Description.....	47
20.2. Status Register (SREG) and Boolean Formula.....	47
21. BRHS – Branch if Half Carry Flag is Set.....	48
21.1. Description.....	48
21.2. Status Register (SREG) and Boolean Formula.....	48

22. BRID – Branch if Global Interrupt is Disabled.....	49
22.1. Description.....	49
22.2. Status Register (SREG) and Boolean Formula.....	49
23. BRIE – Branch if Global Interrupt is Enabled.....	50
23.1. Description.....	50
23.2. Status Register (SREG) and Boolean Formula.....	50
24. BRLO – Branch if Lower (Unsigned).....	51
24.1. Description.....	51
24.2. Status Register (SREG) and Boolean Formula.....	51
25. BRLT – Branch if Less Than (Signed).....	52
25.1. Description.....	52
25.2. Status Register (SREG) and Boolean Formula.....	52
26. BRMI – Branch if Minus.....	53
26.1. Description.....	53
26.2. Status Register (SREG) and Boolean Formula.....	53
27. BRNE – Branch if Not Equal.....	54
27.1. Description.....	54
27.2. Status Register (SREG) and Boolean Formula.....	54
28. BRPL – Branch if Plus.....	55
28.1. Description.....	55
28.2. Status Register (SREG) and Boolean Formula.....	55
29. BRSH – Branch if Same or Higher (Unsigned).....	56
29.1. Description.....	56
29.2. Status Register (SREG) and Boolean Formula.....	56
30. BRTC – Branch if the T Flag is Cleared.....	57
30.1. Description.....	57
30.2. Status Register (SREG) and Boolean Formula.....	57
31. BRTS – Branch if the T Flag is Set.....	58
31.1. Description.....	58
31.2. Status Register (SREG) and Boolean Formula.....	58
32. BRVC – Branch if Overflow Cleared.....	59
32.1. Description.....	59
32.2. Status Register (SREG) and Boolean Formula.....	59
33. BRVS – Branch if Overflow Set.....	60
33.1. Description.....	60
33.2. Status Register (SREG) and Boolean Formula.....	60
34. BSET – Bit Set in SREG.....	61

34.1. Description.....	61
34.2. Status Register (SREG) and Boolean Formula.....	61
35. BST – Bit Store from Bit in Register to T Flag in SREG.....	62
35.1. Description.....	62
35.2. Status Register (SREG) and Boolean Formula.....	62
36. CALL – Long Call to a Subroutine.....	63
36.1. Description.....	63
36.2. Status Register (SREG) and Boolean Formula.....	63
37. CBI – Clear Bit in I/O Register.....	65
37.1. Description.....	65
37.2. Status Register (SREG) and Boolean Formula.....	65
38. CBR – Clear Bits in Register.....	66
38.1. Description.....	66
38.2. Status Register (SREG) and Boolean Formula.....	66
39. CLC – Clear Carry Flag.....	67
39.1. Description.....	67
39.2. Status Register (SREG) and Boolean Formula.....	67
40. CLH – Clear Half Carry Flag.....	68
40.1. Description.....	68
40.2. Status Register (SREG) and Boolean Formula.....	68
41. CLI – Clear Global Interrupt Flag.....	69
41.1. Description.....	69
41.2. Status Register (SREG) and Boolean Formula.....	69
42. CLN – Clear Negative Flag.....	70
42.1. Description.....	70
42.2. Status Register (SREG) and Boolean Formula.....	70
43. CLR – Clear Register.....	71
43.1. Description.....	71
43.2. Status Register (SREG) and Boolean Formula.....	71
44. CLS – Clear Signed Flag.....	72
44.1. Description.....	72
44.2. Status Register (SREG) and Boolean Formula.....	72
45. CLT – Clear T Flag.....	73
45.1. Description.....	73
45.2. Status Register (SREG) and Boolean Formula.....	73
46. CLV – Clear Overflow Flag.....	74
46.1. Description.....	74

46.2. Status Register (SREG) and Boolean Formula.....	74
47. CLZ – Clear Zero Flag.....	75
47.1. Description.....	75
47.2. Status Register (SREG) and Boolean Formula.....	75
48. COM – One’s Complement.....	76
48.1. Description.....	76
48.2. Status Register (SREG) and Boolean Formula.....	76
49. CP – Compare.....	77
49.1. Description.....	77
49.2. Status Register (SREG) and Boolean Formula.....	77
50. CPC – Compare with Carry.....	79
50.1. Description.....	79
50.2. Status Register (SREG) and Boolean Formula.....	79
51. CPI – Compare with Immediate.....	81
51.1. Description.....	81
51.2. Status Register (SREG) and Boolean Formula.....	81
52. CPSE – Compare Skip if Equal.....	83
52.1. Description.....	83
52.2. Status Register (SREG) and Boolean Formula.....	83
53. DEC – Decrement.....	84
53.1. Description.....	84
53.2. Status Register and Boolean Formula.....	84
54. DES – Data Encryption Standard.....	86
54.1. Description.....	86
55. EICALL – Extended Indirect Call to Subroutine.....	87
55.1. Description.....	87
55.2. Status Register (SREG) and Boolean Formula.....	87
56. EIJMP – Extended Indirect Jump.....	88
56.1. Description.....	88
56.2. Status Register (SREG) and Boolean Formula.....	88
57. ELPM – Extended Load Program Memory.....	89
57.1. Description.....	89
57.2. Status Register (SREG) and Boolean Formula.....	90
58. EOR – Exclusive OR.....	91
58.1. Description.....	91
58.2. Status Register (SREG) and Boolean Formula.....	91

59. FMUL – Fractional Multiply Unsigned.....	92
59.1. Description.....	92
59.2. Status Register (SREG) and Boolean Formula.....	92
60. FMULS – Fractional Multiply Signed.....	94
60.1. Description.....	94
60.2. Status Register (SREG) and Boolean Formula.....	94
61. FMULSU – Fractional Multiply Signed with Unsigned.....	96
61.1. Description.....	96
61.2. Status Register (SREG) and Boolean Formula.....	96
62. ICALL – Indirect Call to Subroutine.....	98
62.1. Description.....	98
62.2. Status Register (SREG) and Boolean Formula.....	98
63. IJMP – Indirect Jump.....	99
63.1. Description.....	99
63.2. Status Register (SREG) and Boolean Formula.....	99
64. IN - Load an I/O Location to Register.....	100
64.1. Description.....	100
64.2. Status Register (SREG) and Boolean Formula.....	100
65. INC – Increment.....	101
65.1. Description.....	101
65.2. Status Register and Boolean Formula.....	101
66. JMP – Jump.....	103
66.1. Description.....	103
66.2. Status Register (SREG) and Boolean Formula.....	103
67. LAC – Load and Clear.....	104
67.1. Description.....	104
67.2. Status Register (SREG) and Boolean Formula.....	104
68. LAS – Load and Set.....	105
68.1. Description.....	105
68.2. Status Register (SREG) and Boolean Formula.....	105
69. LAT – Load and Toggle.....	106
69.1. Description.....	106
69.2. Status Register (SREG) and Boolean Formula.....	106
70. LD – Load Indirect from Data Space to Register using Index X.....	107
70.1. Description.....	107
70.2. Status Register (SREG) and Boolean Formula.....	108
71. LD (LDD) – Load Indirect from Data Space to Register using Index Y.....	109

71.1. Description.....	109
71.2. Status Register (SREG) and Boolean Formula.....	110
72. LD (LDD) – Load Indirect From Data Space to Register using Index Z.....	112
72.1. Description.....	112
72.2. Status Register (SREG) and Boolean Formula.....	113
73. LDI – Load Immediate.....	115
73.1. Description.....	115
73.2. Status Register (SREG) and Boolean Formula.....	115
74. LDS – Load Direct from Data Space.....	116
74.1. Description.....	116
74.2. Status Register (SREG) and Boolean Formula.....	116
75. LDS (16-bit) – Load Direct from Data Space.....	117
75.1. Description.....	117
75.2. Status Register (SREG) and Boolean Formula.....	117
76. LPM – Load Program Memory.....	118
76.1. Description.....	118
76.2. Status Register (SREG) and Boolean Formula.....	118
77. LSL – Logical Shift Left.....	120
77.1. Description.....	120
77.2. Status Register (SREG) and Boolean Formula.....	120
78. LSR – Logical Shift Right.....	122
78.1. Description.....	122
78.2. Status Register (SREG) and Boolean Formula.....	122
79. MOV – Copy Register.....	123
79.1. Description.....	123
79.2. Status Register (SREG) and Boolean Formula.....	123
80. MOVW – Copy Register Word.....	124
80.1. Description.....	124
80.2. Status Register (SREG) and Boolean Formula.....	124
81. MUL – Multiply Unsigned.....	125
81.1. Description.....	125
81.2. Status Register (SREG) and Boolean Formula.....	125
82. MULS – Multiply Signed.....	126
82.1. Description.....	126
82.2. Status Register (SREG) and Boolean Formula.....	126
83. MULSU – Multiply Signed with Unsigned.....	127
83.1. Description.....	127

83.2. Status Register (SREG) and Boolean Formula.....	127
84. NEG – Two’s Complement.....	129
84.1. Description.....	129
84.2. Status Register (SREG) and Boolean Formula.....	129
85. NOP – No Operation.....	131
85.1. Description.....	131
85.2. Status Register (SREG) and Boolean Formula.....	131
86. OR – Logical OR.....	132
86.1. Description.....	132
86.2. Status Register (SREG) and Boolean Formula.....	132
87. ORI – Logical OR with Immediate.....	133
87.1. Description.....	133
87.2. Status Register (SREG) and Boolean Formula.....	133
88. OUT – Store Register to I/O Location.....	134
88.1. Description.....	134
88.2. Status Register (SREG) and Boolean Formula.....	134
89. POP – Pop Register from Stack.....	135
89.1. Description.....	135
89.2. Status Register (SREG) and Boolean Formula.....	135
90. PUSH – Push Register on Stack.....	136
90.1. Description.....	136
90.2. Status Register (SREG) and Boolean Formula.....	136
91. RCALL – Relative Call to Subroutine.....	137
91.1. Description.....	137
91.2. Status Register (SREG) and Boolean Formula.....	137
92. RET – Return from Subroutine.....	139
92.1. Description.....	139
92.2. Status Register (SREG) and Boolean Formula.....	139
93. RETI – Return from Interrupt.....	140
93.1. Description.....	140
93.2. Status Register (SREG) and Boolean Formula.....	140
94. RJMP – Relative Jump.....	142
94.1. Description.....	142
94.2. Status Register (SREG) and Boolean Formula.....	142
95. ROL – Rotate Left through Carry.....	143
95.1. Description.....	143
95.2. Status Register (SREG) and Boolean Formula.....	143

96. ROR – Rotate Right through Carry.....	145
96.1. Description.....	145
96.2. Status Register (SREG) and Boolean Formula.....	145
97. SBC – Subtract with Carry.....	147
97.1. Description.....	147
97.2. Status Register (SREG) and Boolean Formula.....	147
98. SBCI – Subtract Immediate with Carry SBI – Set Bit in I/O Register.....	149
98.1. Description.....	149
98.2. Status Register (SREG) and Boolean Formula.....	149
99. SBI – Set Bit in I/O Register.....	151
99.1. Description.....	151
99.2. Status Register (SREG) and Boolean Formula.....	151
100. SBIC – Skip if Bit in I/O Register is Cleared.....	152
100.1. Description.....	152
100.2. Status Register (SREG) and Boolean Formula.....	152
101. SBIS – Skip if Bit in I/O Register is Set.....	153
101.1. Description.....	153
101.2. Status Register (SREG) and Boolean Formula.....	153
102. SBIW – Subtract Immediate from Word.....	154
102.1. Description.....	154
102.2. Status Register (SREG) and Boolean Formula.....	154
103. SBR – Set Bits in Register.....	156
103.1. Description.....	156
103.2. Status Register (SREG) and Boolean Formula.....	156
104. SBRC – Skip if Bit in Register is Cleared.....	157
104.1. Description.....	157
104.2. Status Register (SREG) and Boolean Formula.....	157
105. SBRS – Skip if Bit in Register is Set.....	158
105.1. Description.....	158
105.2. Status Register (SREG) and Boolean Formula.....	158
106. SEC – Set Carry Flag.....	159
106.1. Description.....	159
106.2. Status Register (SREG) and Boolean Formula.....	159
107. SEH – Set Half Carry Flag.....	160
107.1. Description.....	160
107.2. Status Register (SREG) and Boolean Formula.....	160
108. SEI – Set Global Interrupt Flag.....	161

108.1. Description.....	161
108.2. Status Register (SREG) and Boolean Formula.....	161
109. SEN – Set Negative Flag.....	162
109.1. Description.....	162
109.2. Status Register (SREG) and Boolean Formula.....	162
110. SER – Set all Bits in Register.....	163
110.1. Description.....	163
110.2. Status Register (SREG) and Boolean Formula.....	163
111. SES – Set Signed Flag.....	164
111.1. Description.....	164
111.2. Status Register (SREG) and Boolean Formula.....	164
112. SET – Set T Flag.....	165
112.1. Description.....	165
112.2. Status Register (SREG) and Boolean Formula.....	165
113. SEV – Set Overflow Flag.....	166
113.1. Description.....	166
113.2. Status Register (SREG) and Boolean Formula.....	166
114. SEZ – Set Zero Flag.....	167
114.1. Description.....	167
114.2. Status Register (SREG) and Boolean Formula.....	167
115. SLEEP.....	168
115.1. Description.....	168
115.2. Status Register (SREG) and Boolean Formula.....	168
116. SPM – Store Program Memory.....	169
116.1. Description.....	169
116.2. Status Register (SREG) and Boolean Formula.....	169
117. SPM #2 – Store Program Memory.....	171
117.1. Description.....	171
117.2. Status Register (SREG) and Boolean Formula.....	171
118. ST – Store Indirect From Register to Data Space using Index X.....	173
118.1. Description.....	173
118.2. Status Register (SREG) and Boolean Formula.....	174
119. ST (STD) – Store Indirect From Register to Data Space using Index Y.....	175
119.1. Description.....	175
119.2. Status Register (SREG) and Boolean Formula.....	176
120. ST (STD) – Store Indirect From Register to Data Space using Index Z.....	177
120.1. Description.....	177

120.2. Status Register (SREG) and Boolean Formula.....	178
121. STS – Store Direct to Data Space.....	179
121.1. Description.....	179
121.2. Status Register (SREG) and Boolean Formula.....	179
122. STS (16-bit) – Store Direct to Data Space.....	180
122.1. Description.....	180
122.2. Status Register (SREG) and Boolean Formula.....	180
123. SUB – Subtract Without Carry.....	181
123.1. Description.....	181
123.2. Status Register and Boolean Formula.....	181
124. SUBI – Subtract Immediate.....	183
124.1. Description.....	183
124.2. Status Register and Boolean Formula.....	183
125. SWAP – Swap Nibbles.....	185
125.1. Description.....	185
125.2. Status Register (SREG) and Boolean Formula.....	185
126. TST – Test for Zero or Minus.....	186
126.1. Description.....	186
126.2. Status Register (SREG) and Boolean Formula.....	186
127. WDR – Watchdog Reset.....	187
127.1. Description.....	187
127.2. Status Register (SREG) and Boolean Formula.....	187
128. XCH – Exchange.....	188
128.1. Description.....	188
128.2. Status Register (SREG) and Boolean Formula.....	188

1. I/O Registers

1.1. RAMPX, RAMPY, and RAMPZ

Registers concatenated with the X-, Y-, and Z-registers enabling indirect addressing of the whole data space on MCUs with more than 64KB data space, and constant data fetch on MCUs with more than 64KB program space.

1.2. RAMPD

Register concatenated with the Z-register enabling direct addressing of the whole data space on MCUs with more than 64KB data space.

1.3. EIND

Register concatenated with the Z-register enabling indirect jump and call to the whole program space on MCUs with more than 64K words (128KB) program space.

1.4. Stack

STACK	Stack for return address and pushed registers
SP	Stack Pointer to STACK

1.5. Flags

↔	Flag affected by instruction
0	Flag cleared by instruction
1	Flag set by instruction
-	Flag not affected by instruction

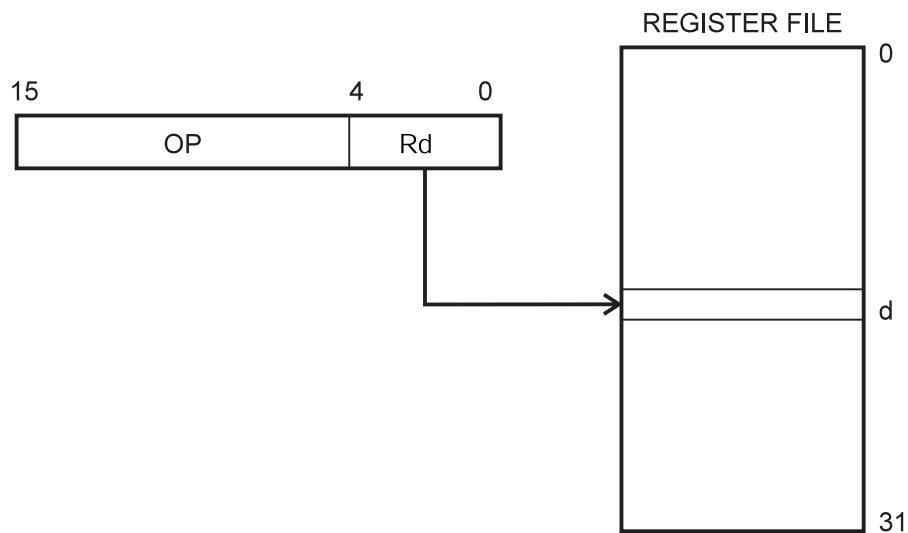

2. The Program and Data Addressing Modes

The AVR[®] Enhanced RISC microcontroller supports powerful and efficient addressing modes for access to the Program memory (Flash) and Data memory (SRAM, Register file, I/O Memory, and Extended I/O Memory). This chapter describes the various addressing modes supported by the AVR architecture. In the following figures, OP means the operation code part of the instruction word. To simplify, not all figures show the exact location of the addressing bits. To generalize, the abstract terms RAMEND and FLASHEND have been used to represent the highest location in data and program space, respectively.

Note: Not all addressing modes are present in all devices. Refer to the device specific instruction summary.

2.1. Register Direct, Single Register Rd

Figure 2-1. Direct Single Register Addressing

The operand is contained in register d (Rd).

2.2. Register Direct - Two Registers, Rd and Rr

Figure 2-2. Direct Register Addressing, Two Registers

Operands are contained in register r (Rr) and d (Rd). The result is stored in register d (Rd).

2.3. I/O Direct

Figure 2-3. I/O Direct Addressing

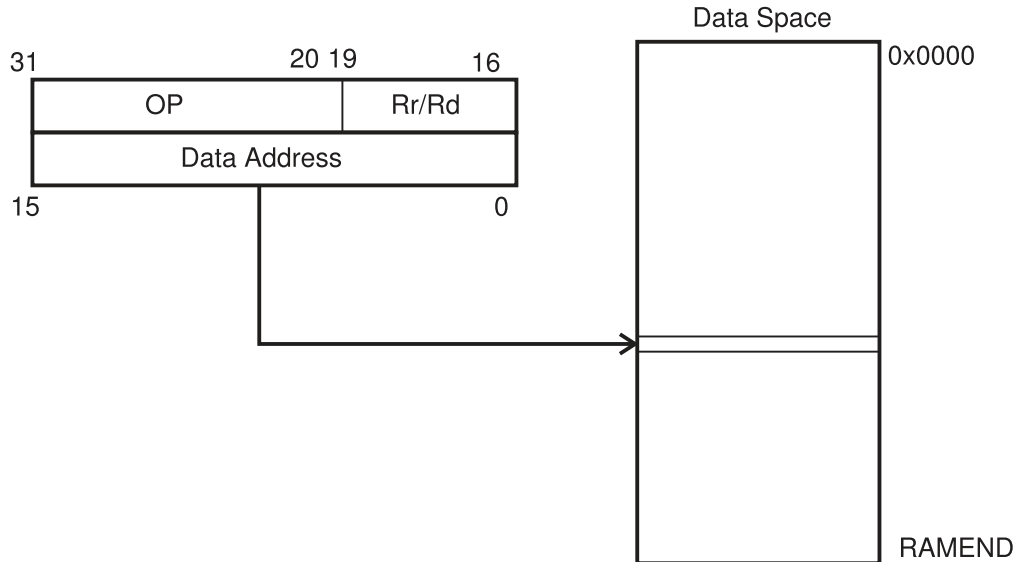

Operand address is contained in six bits of the instruction word. n is the destination or source register address.

Note: Some complex AVR Microcontrollers have more peripheral units than can be supported within the 64 locations reserved in the opcode for I/O direct addressing. The extended I/O memory from address 64 to 255 can only be reached by data addressing, not I/O addressing.

2.4. Data Direct

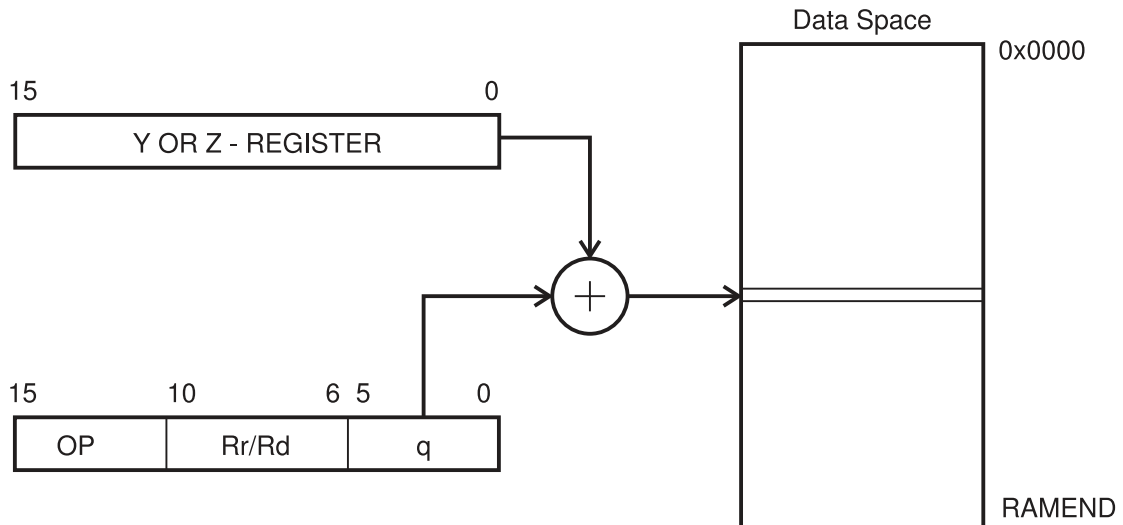

Figure 2-4. Direct Data Addressing

A 16-bit Data Address is contained in the 16 LSBs of a two-word instruction. Rd/Rr specify the destination or source register.

2.5. Data Indirect with Displacement

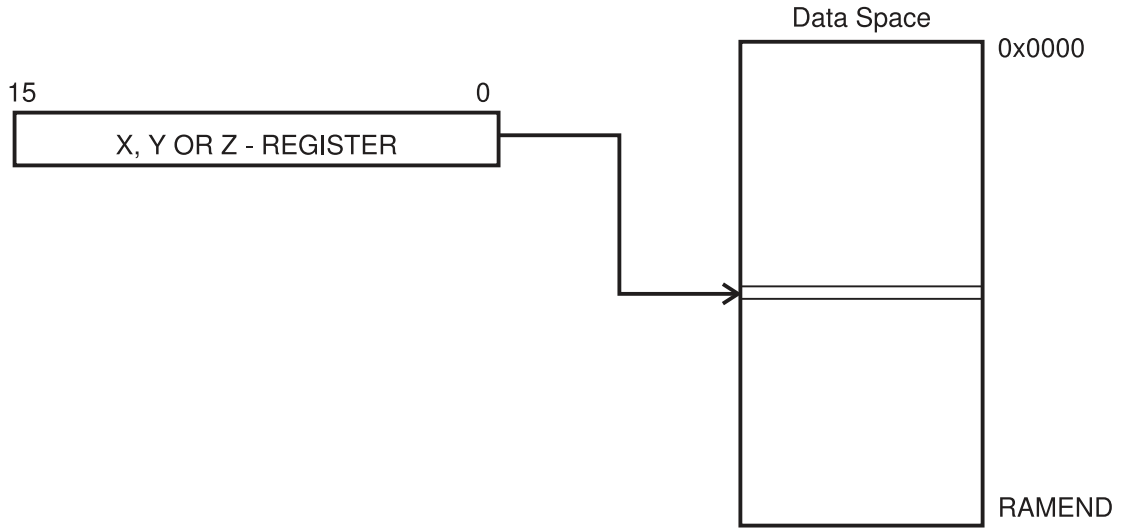

Figure 2-5. Data Indirect with Displacement

Operand address is the result of the Y- or Z-register contents added to the address contained in six bits of the instruction word. Rd/Rr specify the destination or source register.

2.6. Data Indirect

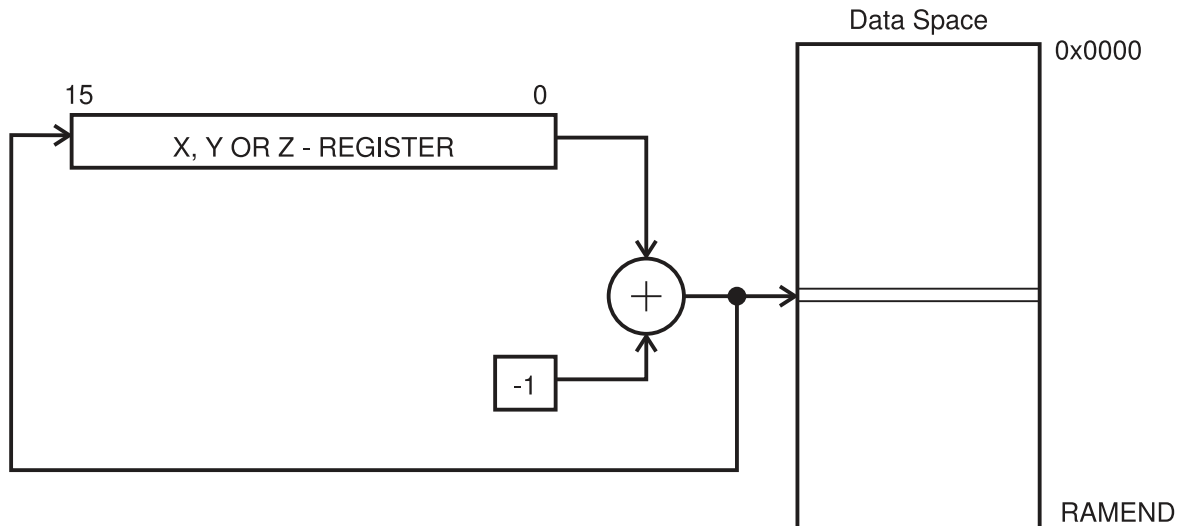

Figure 2-6. Data Indirect Addressing

Operand address is the contents of the X-, Y-, or the Z-register. In AVR devices without SRAM, Data Indirect Addressing is called Register Indirect Addressing. Register Indirect Addressing is a subset of Data Indirect Addressing since the data space from 0 to 31 is the Register File.

2.7. Data Indirect with Pre-decrement

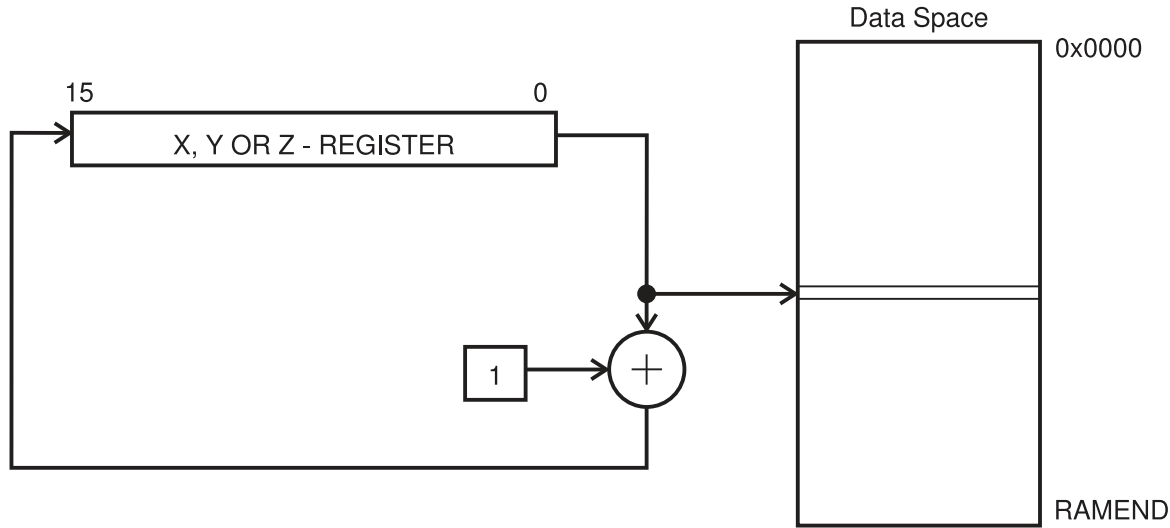

Figure 2-7. Data Indirect Addressing with Pre-decrement

The X-, Y-, or the Z-register is decremented before the operation. Operand address is the decremented contents of the X-, Y-, or the Z-register.

2.8. Data Indirect with Post-increment

Figure 2-8. Data Indirect Addressing with Post-increment

The X-, Y-, or the Z-register is incremented after the operation. Operand address is the content of the X-, Y-, or the Z-register prior to incrementing.

2.9. Program Memory Constant Addressing using the LPM, ELPM, and SPM Instructions

Figure 2-9. Program Memory Constant Addressing

Constant byte address is specified by the Z-register contents. The 15 MSBs select word address. For LPM, the LSB selects low byte if cleared (LSB = 0) or high byte if set (LSB = 1). For SPM, the LSB should be cleared. If ELPM is used, the RAMPZ Register is used to extend the Z-register.

2.10. Program Memory with Post-increment using the LPM Z+ and ELPM Z+ Instruction

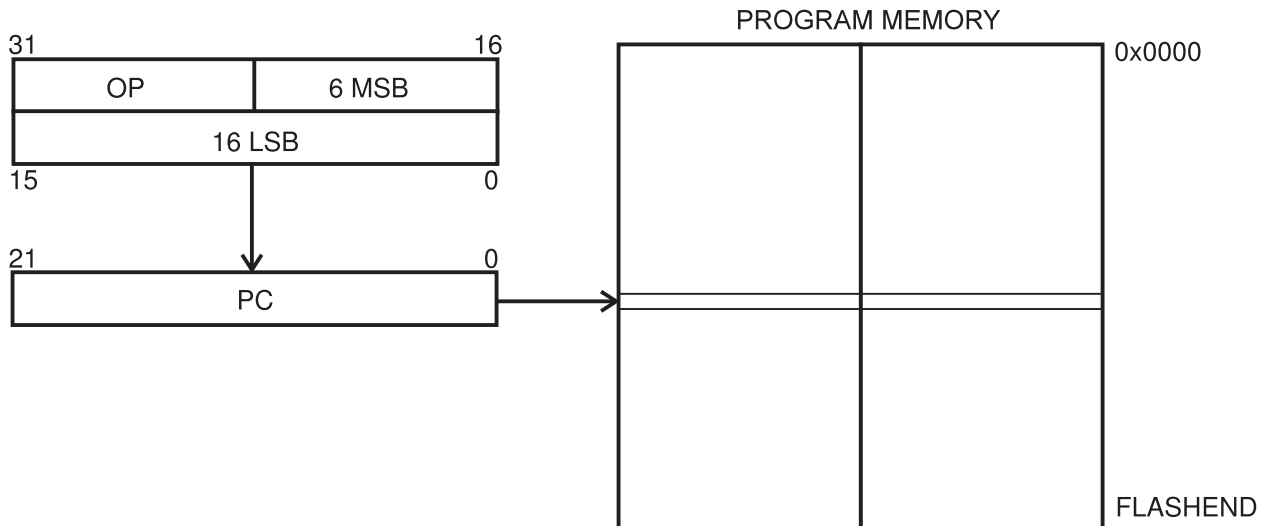

Figure 2-10. Program Memory Addressing with Post-increment

Constant byte address is specified by the Z-register contents. The 15 MSBs select word address. The LSB selects low byte if cleared (LSB = 0) or high byte if set (LSB = 1). If ELPM Z+ is used, the RAMPZ Register is used to extend the Z-register.

2.11. Direct Program Addressing, JMP and CALL

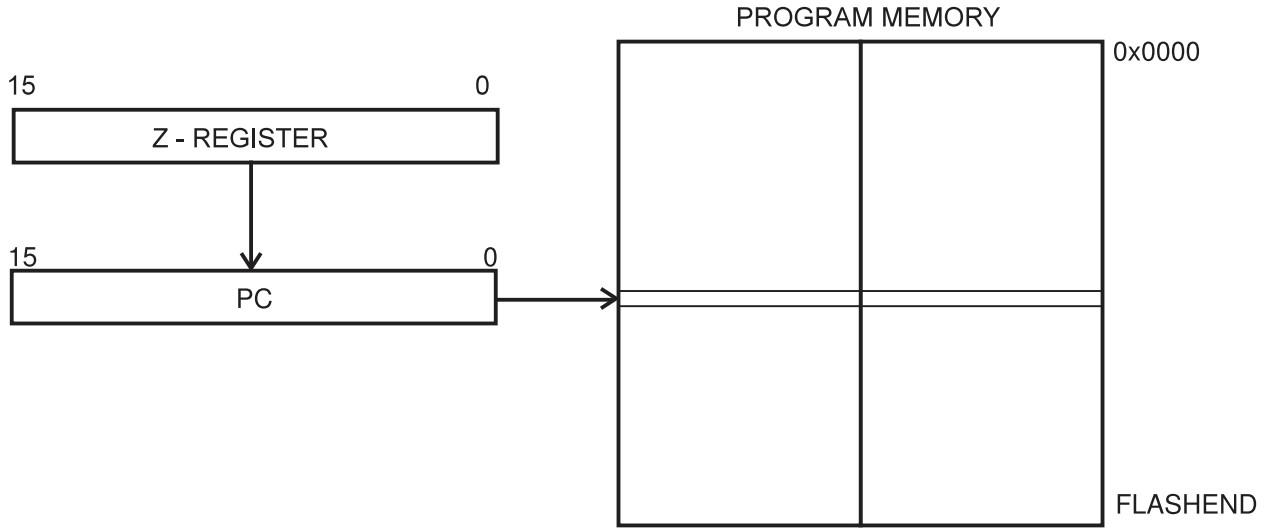

Figure 2-11. Direct Program Memory Addressing

Program execution continues at the address immediate in the instruction word.

2.12. Indirect Program Addressing, IJMP and ICALL

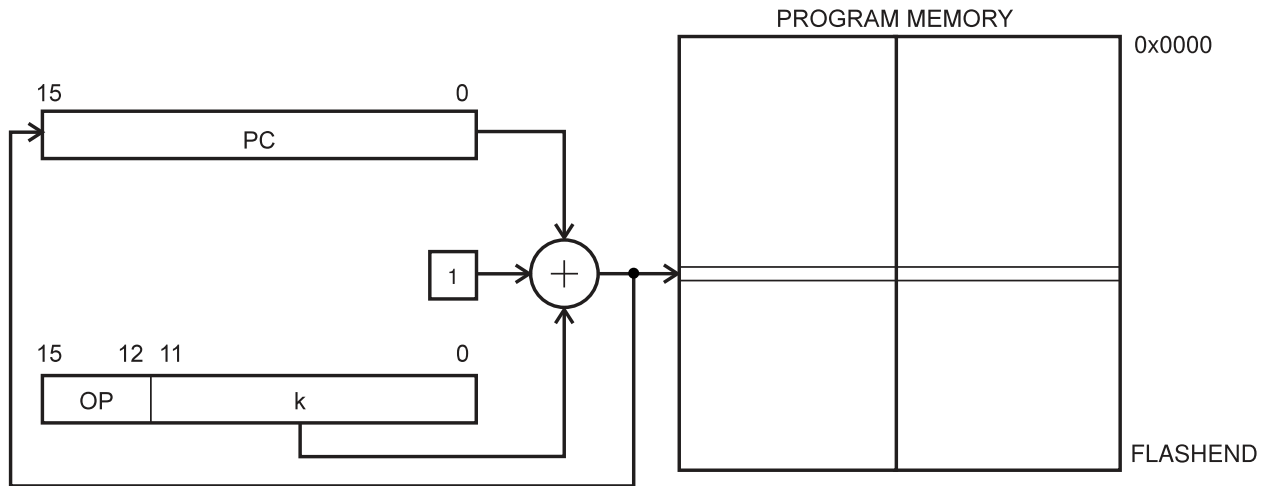

Figure 2-12. Indirect Program Memory Addressing

Program execution continues at address contained by the Z-register (i.e., the PC is loaded with the contents of the Z-register).

2.13. Relative Program Addressing, RJMP and RCALL

Figure 2-13. Relative Program Memory Addressing

Program execution continues at address $PC + k + 1$. The relative address k is from -2048 to 2047.

4. Instruction Set Summary

Several updates of the AVR CPU during its lifetime has resulted in different flavors of the instruction set, especially for the timing of the instructions. Machine code level of compatibility is intact for all CPU versions with a very few exceptions related to the Reduced Core (AVRrc), though not all instructions are included in the instruction set for all devices. The table below contains the major versions of the AVR 8-bit CPUs. In addition to the different versions, there are differences dependent of the size of the device memory map. Typically these differences are handled by a C/EC++ compiler, but users that are porting code should be aware that the code execution can vary slightly in number of clock cycles.

Table 4-1. Versions of AVR 8-bit CPU

Name	Device Series	Description
AVR	AT90	Original instruction set from 1995.
AVRe	megaAVR [®]	Multiply (xMULxx), Move Word (MOVW), and enhanced Load Program Memory (LPM) added to the AVR instruction set. No timing differences.
AVRe	tinyAVR [®]	Multiply not included, but else equal to AVRe for megaAVR.
AVRxm	XMEGA [®]	Significantly different timing compared to AVR(e). The Read Modify Write (RMW) and DES encryption instructions are unique to this version.
AVRxt	(AVR)	AVR 2016 and onwards. This variant is based on AVRe and AVRxm. Closer related to AVRe, but with improved timing.
AVRrc	tinyAVR	The Reduced Core AVR CPU was developed for ultra-low pinout (6-pin) size constrained devices. The AVRrc therefore only has a 16 registers register-file (R31-R16) and a limited instruction set.

Note:

1. Cycle time for data memory accesses assume internal RAM access, and are not valid for accesses through the NVM controller. A minimum of one extra cycle must be added when accessing memory through the NVM controller (such as Flash and EEPROM), but depending on simultaneous accesses by other masters or the NVM controller state, there may be more than one extra cycle.
2. One extra cycle must be added when accessing lower (64 bytes of) I/O space.
3. The instruction is not available on all devices.
4. Device dependent. See the device specific datasheet.

5. ADC – Add with Carry

5.1. Description

Adds two registers and the contents of the C Flag and places the result in the destination register Rd.

Operation:

$$(i) \quad R_d \leftarrow R_d + R_r + C$$

Syntax:

$$(i) \quad \text{ADC } R_d, R_r$$

Operands:

$$0 \leq d \leq 31, 0 \leq r \leq 31$$

Program Counter:

$$PC \leftarrow PC + 1$$

16-bit Opcode:

0001	11rd	dddd	rrrr
------	------	------	------

5.2. Status Register (SREG) and Boolean Formula

I	T	H	S	V	N	Z	C

$$\mathbf{H} \quad R_{d3} \cdot R_{r3} + R_{r3} \cdot \overline{R_3} + \overline{R_3} \cdot R_{d3}$$

Set if there was a carry from bit 3; cleared otherwise.

$$\mathbf{S} \quad N \oplus V, \text{ for signed tests.}$$

$$\mathbf{V} \quad R_{d7} \cdot R_{r7} \cdot \overline{R_7} + \overline{R_{d7}} \cdot \overline{R_{r7}} \cdot R_7$$

Set if two's complement overflow resulted from the operation; cleared otherwise.

$$\mathbf{N} \quad R_7$$

Set if MSB of the result is set; cleared otherwise.

$$\mathbf{Z} \quad \overline{R_7} \cdot \overline{R_6} \cdot \overline{R_5} \cdot \overline{R_4} \cdot \overline{R_3} \cdot \overline{R_2} \cdot \overline{R_1} \cdot \overline{R_0}$$

Set if the result is \$00; cleared otherwise.

$$\mathbf{C} \quad R_{d7} \cdot R_{r7} + R_{r7} \cdot \overline{R_7} + \overline{R_7} \cdot R_{d7}$$

Set if there was carry from the MSB of the result; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```

6. ADD – Add without Carry

6.1. Description

Adds two registers without the C Flag and places the result in the destination register Rd.

Operation:

- (i) $Rd \leftarrow Rd + Rr$

Syntax:

- (i) ADD Rd,Rr

Operands:

- $0 \leq d \leq 31, 0 \leq r \leq 31$

Program Counter:

H $Rd3 \cdot Rr3 + Rr3 \cdot \overline{Rd3} + \overline{Rd3} \cdot Rr3$

Set if there was a carry from bit 3; cleared otherwise.

S $N \oplus V$, for signed tests.

V $Rd7 \cdot Rr7 \cdot \overline{R7} + \overline{Rd7} \cdot \overline{Rr7} \cdot R7$

Set if two's complement overflow resulted from the operation; cleared otherwise.

N R7

Set if MSB of the result is set; cleared otherwise.

Z $\overline{R7} \cdot \overline{R6} \cdot \overline{R5} \cdot \overline{R4} \cdot \overline{R3} \cdot \overline{R2} \cdot \overline{R1} \cdot \overline{R0}$

7. ADIW – Add Immediate to Word

7.1. Description

Adds an immediate value (0 - 63) to a register pair and places the result in the register pair. This instruction operates on the upper four register pairs, and is well suited for operations on the pointer registers.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

$$(i) \quad R_{d+1}:R_d \leftarrow R_{d+1}:R_d + K$$

Syntax:

Operands:

Program Counter:

$$(i) \quad \text{ADIW } R_{d+1}:R_d, K \quad d \in \{24,26,28,30\}, 0 \leq K \leq 63 \quad PC \leftarrow PC + 1$$

16-bit Opcode:

7.2. Status Register (SREG) and Boolean Formula

I	T	H	S	V	N	Z	C
–	–	–	↔	↔	↔	↔	↔

S $N \oplus V$, for signed tests.

V $\overline{R_{dh7}} \cdot R_{15}$

Set if two's complement overflow resulted from the operation; cleared otherwise.

N R_{15}

Set if MSB of the result is set; cleared otherwise.

Z $\overline{R_{15}} \cdot \overline{R_{14}} \cdot \overline{R_{13}} \cdot \overline{R_{12}} \cdot \overline{R_{11}} \cdot \overline{R_{10}} \cdot \overline{R_9} \cdot \overline{R_8} \cdot \overline{R_7} \cdot \overline{R_6} \cdot \overline{R_5} \cdot \overline{R_4} \cdot \overline{R_3} \cdot \overline{R_2} \cdot \overline{R_1} \cdot \overline{R_0}$

Set if the result is \$0000; cleared otherwise.

C $\overline{R_{15}} \cdot R_{dh7}$

Set if there was carry from the MSB of the result; cleared otherwise.

R (Result) equals R_{dh}:R_{dl} after the operation (R_{dh7}-R_{dh0} = R₁₅-R₈, R_{dl7}-R_{dl0}=R₇-R₀).

Example:

```

10. ASR – Arithmetic Shift Right

10.1. Description

Shifts all bits in Rd one place to the right. Bit 7 is held constant. Bit 0 is loaded into the C Flag of the SREG. This operation effectively divides a signed value by two without changing its sign. The Carry Flag can be used to round the result.

Operation:

Syntax:

Operands:

Program Counter:

(i) ASR Rd

$0 \leq d \leq 31$

$PC \leftarrow PC + 1$

16-bit Opcode:

Z $\overline{R7} \cdot \overline{R6} \cdot \overline{R5} \cdot \overline{R4} \cdot \overline{R3} \cdot \overline{R2} \cdot \overline{R1} \cdot \overline{R0}$

Set if the result is \$00; cleared otherwise.

C Rd0

Set if, before the shift, the LSB of Rd was set; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
ldi r16,$10 ; Load decimal 16 into r16

17. BREAK – Break

17.1. Description

The BREAK instruction is used by the On-chip Debug system, and is normally not used in the application software. When the BREAK instruction is executed, the AVR CPU is set in the Stopped Mode. This gives the On-chip Debugger access to internal resources.

If any Lock bits are set, or either the JTAGEN or OCDEN Fuses are unprogrammed, the CPU will treat the BREAK instruction as a NOP and will not enter the Stopped mode.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

23. BRIE – Branch if Global Interrupt is Enabled

23.1. Description

Conditional relative branch. Tests the Global Interrupt Flag (I) and branches relatively to PC if I is set. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). Parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBS 7,k.)

Operation:

- (i) If I = 1 then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

Operands:

Program Counter:

- (i) BRIE k

$-64 \leq k \leq +63$

$PC \leftarrow PC + k + 1$

$PC \leftarrow PC + 1$, if condition is false

24. BRLO – Branch if Lower (Unsigned)

24.1. Description

Conditional relative branch. Tests the Carry Flag (C) and branches relatively to PC if C is set. If the instruction is executed immediately after any of the instructions CP, CPI, SUB, or SUBI, the branch will occur if and only if, the unsigned binary number represented in Rd was smaller than the unsigned binary number represented in Rr. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). Parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBS 0,k.)

Operation:

25. BRLT – Branch if Less Than (Signed)

25.1. Description

Conditional relative branch. Tests the Signed Flag (S) and branches relatively to PC if S is set. If the instruction is executed immediately after any of the instructions CP, CPI, SUB, or SUBI, the branch will occur if and only if, the signed binary number represented in Rd was less than the signed binary number represented in Rr. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). Parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBS 4,k.)

Operation:

- (i) If $Rd < Rr$ ($N \oplus V = 1$) then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

Operands:

Program Counter:

36. CALL – Long Call to a Subroutine

36.1. Description

Calls to a subroutine within the entire Program memory. The return address (to the instruction after the CALL) will be stored onto the Stack. (See also RCALL). The Stack Pointer uses a post-decrement scheme during CALL.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) PC ← k Devices with 16-bit PC, 128KB Program memory maximum.
- (ii) PC ← k Devices with 22-bit PC, 8MB Program memory maximum.

Syntax:	Operands:	Program Counter:	Stack:

53. DEC – Decrement

53.1. Description

Subtracts one -1- from the contents of register Rd and places the result in the destination register Rd.

The C Flag in SREG is not affected by the operation, thus allowing the DEC instruction to be used on a loop counter in multiple-precision computations.

When operating on unsigned values, only BREQ and BRNE branches can be expected to perform consistently. When operating on two's complement values, all signed branches are available.

Operation:

$$(i) \quad Rd \leftarrow Rd - 1$$

Syntax:

54. DES – Data Encryption Standard

54.1. Description

The module is an instruction set extension to the AVR CPU, performing DES iterations. The 64-bit data block (plaintext or ciphertext) is placed in the CPU register file, registers R0-R7, where LSB of data is placed in LSB of R0 and MSB of data is placed in MSB of R7. The full 64-bit key (including parity bits) is placed in registers R8-R15, organized in the register file with LSB of key in LSB of R8 and MSB of key in MSB of R15. Executing one DES instruction performs one round in the DES algorithm. Sixteen rounds must be executed in increasing order to form the correct DES ciphertext or plaintext. Intermediate results are stored in the register file (R0-R15) after each DES instruction. The instruction's operand (K) determines which round is executed, and the half carry flag (H) determines whether encryption or decryption is performed.

The DES algorithm is described in “Specifications for the Data Encryption Standard” (Federal Information Processing Standards Publication 46). Intermediate results in this implementation differ from the standard because the initial permutation and the inverse initial permutation are performed in each iteration. This does not affect the result in the final ciphertext or plaintext, but reduces the execution time.

Operation:

- (i) If H = 0 then Encrypt round (R7-R0, R15-R8, K)
- If H = 1 then Decrypt round (R7-R0, R15-R8, K)

Syntax:

57. ELPM – Extended Load Program Memory

57.1. Description

Loads one byte pointed to by the Z-register and the RAMPZ Register in the I/O space, and places this byte in the destination register Rd. This instruction features a 100% space effective constant initialization or constant data fetch. The Program memory is organized in 16-bit words while the Z-pointer is a byte address. Thus, the least significant bit of the Z-pointer selects either low byte ($Z_{LSB} = 0$) or high byte ($Z_{LSB} = 1$). This instruction can address the entire Program memory space. The Z-pointer Register can either be left unchanged by the operation, or it can be incremented. The incrementation applies to the entire 24-bit concatenation of the RAMPZ and Z-pointer Registers.

Devices with Self-Programming capability can use the ELPM instruction to read the Fuse and Lock bit value. Refer to the device documentation for a detailed description.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

The result of these combinations is undefined:

59. FMUL – Fractional Multiply Unsigned

59.1. Description

This instruction performs 8-bit × 8-bit → 16-bit unsigned multiplication and shifts the result one bit left.

Let (N.Q) denote a fractional number with N binary digits left of the radix point, and Q binary digits right of the radix point. A multiplication between two numbers in the formats (N1.Q1) and (N2.Q2) results in the format ((N1+N2).(Q1+Q2)). For signal processing applications, the format (1.7) is widely used for the inputs, resulting in a (2.14) format for the product. A left shift is required for the high byte of the product to be in the same format as the inputs. The FMUL instruction incorporates the shift operation in the same number of cycles as MUL.

The (1.7) format is most commonly used with signed numbers, while FMUL performs an unsigned multiplication. This instruction is therefore most useful for calculating one of the partial products when performing a signed multiplication with 16-bit inputs in the (1.15) format, yielding a result in the (1.31) format. Note: the result of the FMUL operation may suffer from a 2's complement overflow if interpreted as a number in the (1.15) format. The MSB of the multiplication before shifting must be taken into account, and is found in the carry bit. See the following example.

The multiplicand Rd and the multiplier Rr are two registers containing unsigned fractional numbers where the implicit radix point lies between bit 6 and bit 7. The 16-bit unsigned fractional product with the implicit radix point between bit 14 and bit 15 is placed in R1 (high byte) and R0 (low byte).

This instruction is not available in all devices. Refer to the device specific instruction set summary.

60. FMULS – Fractional Multiply Signed

60.1. Description

This instruction performs 8-bit × 8-bit → 16-bit signed multiplication and shifts the result one bit left.

Let (N.Q) denote a fractional number with N binary digits left of the radix point, and Q binary digits right of the radix point. A multiplication between two numbers in the formats (N1.Q1) and (N2.Q2) results in the format ((N1+N2).(Q1+Q2)). For signal processing applications, the format (1.7) is widely used for the inputs, resulting in a (2.14) format for the product. A left shift is required for the high byte of the product to be in the same format as the inputs. The FMULS instruction incorporates the shift operation in the same number of cycles as MULS.

The multiplicand Rd and the multiplier Rr are two registers containing signed fractional numbers where the implicit radix point lies between bit 6 and bit 7. The 16-bit signed fractional product with the implicit radix point between bit 14 and bit 15 is placed in R1 (high byte) and R0 (low byte).

Note that when multiplying 0x80 (-1) with 0x80 (-1), the result of the shift operation is 0x8000 (-1). The shift operation thus gives a two's complement overflow. This must be checked and handled by software.

61. FMULSU – Fractional Multiply Signed with Unsigned

61.1. Description

This instruction performs 8-bit × 8-bit → 16-bit signed multiplication and shifts the result one bit left.

Let (N.Q) denote a fractional number with N binary digits left of the radix point, and Q binary digits right of the radix point. A multiplication between two numbers in the formats (N1.Q1) and (N2.Q2) results in the format ((N1+N2).(Q1+Q2)). For signal processing applications, the format (1.7) is widely used for the inputs, resulting in a (2.14) format for the product. The (1.7) format is most commonly used with signed numbers, while FMULSU performs a multiplication with one unsigned and one signed input. This instruction is therefore most useful for calculating two of the partial products when performing a signed multiplication with 16-bit inputs in the (1.15) format, yielding a result in the (1.31) format. Note: the result of the FMULSU operation may suffer from a 2's complement overflow if interpreted as a number in the (1.15) format. 62. ICALL – Indirect Call to Subroutine

62.1. Description

Calls to a subroutine within the entire 4M (words) Program memory. The return address (to the instruction after the CALL) will be stored onto the Stack. See also RCALL. The Stack Pointer uses a post-decrement scheme during CALL.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:	Comment:		
(i) $PC(15:0) \leftarrow Z(15:0)$	Devices with 16-bit PC, 128KB Program memory maximum.		
(ii) $PC(15:0) \leftarrow Z(15:0)$ $PC(21:16) \leftarrow 0$	Devices with 22-bit PC, 8MB Program memory maximum.		
Syntax:	Operands:	Program Counter:	Stack:

63. IJMP – Indirect Jump

63.1. Description

Indirect jump to the address pointed to by the Z (16 bits) Pointer Register in the Register File. The Z-pointer Register is 16 bits wide and allows jump within the lowest 64K words (128KB) section of Program memory.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:	Comment:

64. IN - Load an I/O Location to Register

64.1. Description

Loads data from the I/O Space (Ports, Timers, Configuration Registers, etc.) into register Rd in the Register File.

Operation:

- (i) $Rd \leftarrow I/O(A)$

Syntax:

Operands:

Program Counter:

- (i) IN Rd,A

$0 \leq d \leq 31, 0 \leq A \leq 63$

65. INC – Increment

65.1. Description

Adds one -1- to the contents of register Rd and places the result in the destination register Rd.

The C Flag in SREG is not affected by the operation, thus allowing the INC instruction to be used on a loop counter in multiple-precision computations.

When operating on unsigned numbers, only BREQ and BRNE branches can be expected to perform consistently. When operating on two's complement values, all signed branches are available.

Operation:

(i) $Rd \leftarrow Rd + 1$

Syntax:

Operands:

Program Counter:

(i) INC Rd

$0 \leq d \leq 31$

$PC \leftarrow PC + 1$

16-bit Opcode:

V $R7 \cdot \overline{R6} \cdot \overline{R5} \cdot \overline{R4} \cdot \overline{R3} \cdot \overline{R2} \cdot \overline{R1} \cdot \overline{R0}$

Set if two's complement overflow resulted from the operation; cleared otherwise. Two's complement overflow occurs if and only if Rd was \$7F before the operation.

N R7

Set if MSB of the result is set; cleared otherwise.

Z $\overline{R7} \cdot \overline{R6} \cdot \overline{R5} \cdot \overline{R4} \cdot \overline{R3} \cdot \overline{R2} \cdot \overline{R1} \cdot \overline{R0}$

Set if the result is \$00; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
clr r22 ; clear r22
loop: inc r22 ; increment r22
...

67. LAC – Load and Clear

67.1. Description

Load one byte indirect from data space to register and stores and clear the bits in data space specified by the register. The instruction can only be used towards internal SRAM.

The data location is pointed to by the Z (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64KB. To access another data segment in devices with more than 64KB data space, the RAMPZ in register in the I/O area has to be changed.

The Z-pointer Register is left unchanged by the operation. This instruction is especially suited for clearing status bits stored in SRAM.

Operation:

70. LD – Load Indirect from Data Space to Register using Index X

70.1. Description

Loads one byte indirect from the data space to a register. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash Memory has been mapped to the data space and can be read using this command. The EEPROM has a separate address space.

The data location is pointed to by the X (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64KB. To access another data segment in devices with more than 64KB data space, the RAMPX in register in the I/O area has to be changed.

The X-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for accessing arrays, tables, and Stack Pointer usage of the X-pointer Register. Note that only the low byte of the X-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPX Register in the I/O area is updated in parts with more than 64KB data space or more than 64KB Program memory, and the increment/decrement is added to the entire 24-bit address on such devices.

Not all variants of this instruction is available in all devices. Refer to the device specific instruction set summary.

In the Reduced Core tinyAVR the LD instruction can be used to achieve the same operation as LPM since the program memory is mapped to the data memory space.

The result of these combinations is undefined:

71. LD (LDD) – Load Indirect from Data Space to Register using Index Y

71.1. Description

Loads one byte indirect with or without displacement from the data space to a register. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash Memory has been mapped to the data space and can be read using this command. 72. LD (LDD) – Load Indirect From Data Space to Register using Index Z

72.1. Description

Loads one byte indirect with or without displacement from the data space to a register. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash Memory has been mapped to the data space and can be read using this command. The EEPROM has a separate address space.

The data location is pointed to by the Z (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64KB. To access another data segment in devices with more than 64KB data space, the RAMPZ in register in the I/O area has to be changed.

The Z-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for Stack Pointer usage of the Z-pointer Register, however, because the Z-pointer Register can be used for indirect subroutine calls, indirect jumps and table look-up, it is often more convenient to use the X- or Y-pointer as a dedicated Stack Pointer. Note that only the low byte of the Z-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPZ Register in the I/O area is updated in parts with more than 64KB data space or more than 64KB Program memory, and the increment/decrement/displacement is added to the entire 24-bit address on such devices.

76. LPM – Load Program Memory

76.1. Description

Loads one byte pointed to by the Z-register into the destination register Rd. This instruction features a 100% space effective constant initialization or constant data fetch. The Program memory is organized in 16-bit words while the Z-pointer is a byte address. Thus, the least significant bit of the Z-pointer selects either low byte ($Z_{LSB} = 0$) or high byte ($Z_{LSB} = 1$). This instruction can address the first 64KB (32K words) of Program memory. The Z-pointer Register can either be left unchanged by the operation, or it can be incremented. The incrementation does not apply to the RAMPZ Register.

Devices with Self-Programming capability can use the LPM instruction to read the Fuse and Lock bit values. Refer to the device documentation for a detailed description.

The LPM instruction is not available in all devices. Refer to the device specific instruction set summary.

The result of these combinations is undefined:

Cycles 4 devices with 16-bit PC
 5 devices with 22-bit PC

Note: RETI behaves differently in megaAVR and AVR XMEGA devices. In the megaAVR series of devices, the global interrupt flag is cleared by hardware once an interrupt occurs and this bit is set when RETI is executed. In the AVR XMEGA devices, RETI will not modify the global interrupt flag in SREG

since it is not cleared by hardware while entering ISR. This bit should be modified using SEI and CLI instructions when needed.

94. RJMP – Relative Jump

94.1. Description

Relative jump to an address within $PC - 2K + 1$ and $PC + 2K$ (words). For AVR microcontrollers with Program memory not exceeding 4K words (8KB) this instruction can address the entire memory from every address location. See also JMP.

Operation:

(i) $PC \leftarrow PC + k + 1$

Syntax: Operands: Program Counter: Stack:

(i) RJMP $k - 2K \leq k < 2K$ $PC \leftarrow PC + k + 1$ Unchanged

95. ROL – Rotate Left through Carry

95.1. Description

Shifts all bits in Rd one place to the left. The C Flag is shifted into bit 0 of Rd. Bit 7 is shifted into the C Flag. This operation, combined with LSL, effectively multiplies multi-byte signed and unsigned values by two.

Operation:

	Syntax:	Operands:	Program Counter:

96. ROR – Rotate Right through Carry

96.1. Description

Shifts all bits in Rd one place to the right. The C Flag is shifted into bit 7 of Rd. Bit 0 is shifted into the C Flag. This operation, combined with ASR, effectively divides multi-byte signed values by two. Combined with LSR it effectively divides multi-byte unsigned values by two. The Carry Flag can be used to round the result.

Operation:

Syntax: Operands: Program Counter:

116. SPM – Store Program Memory

116.1. Description

SPM can be used to erase a page in the Program memory, to write a page in the Program memory (that is already erased), and to set Boot Loader Lock bits. In some devices, the Program memory can be written one word at a time, in other devices an entire page can be programmed simultaneously after first filling a temporary page buffer. In all cases, the Program memory must be erased one page at a time. When erasing the Program memory, the RAMPZ and Z-register are used as page address. When writing the Program memory, the RAMPZ and Z-register are used as page or word address, and the R1:R0 register pair is used as data⁽¹⁾. When setting the Boot Loader Lock bits, the R1:R0 register pair is used as data. Refer to the device documentation for detailed description of SPM usage. This instruction can address the entire Program memory.

The SPM instruction is not available in all devices. Refer to the device specific instruction set summary.

Note: 1. R1 determines the instruction high byte, and R0 determines the instruction low byte.

Operation:

- (i) (RAMPZ:Z) ← \$ffff Erase Program memory page
- (ii) (RAMPZ:Z) ← R1:R0 Write Program memory word
- (iii) (RAMPZ:Z) ← R1:R0 Write temporary page buffer
- (iv) (RAMPZ:Z) ← TEMP Write temporary page buffer to Program memory

117. SPM #2 – Store Program Memory

117.1. Description

SPM can be used to erase a page in the Program memory and to write a page in the Program memory (that is already erased). An entire page can be programmed simultaneously after first filling a temporary page buffer. The Program memory must be erased one page at a time. When erasing the Program memory, the RAMPZ and Z-register are used as page address. When writing the Program memory, the RAMPZ and Z-register are used as page or word address, and the R1:R0 register pair is used as data⁽¹⁾.

Refer to the device documentation for detailed description of SPM usage. This instruction can address the entire Program memory.

Note: 1. R1 determines the instruction high byte, and R0 determines the instruction low byte.

Operation:

- (i) (RAMPZ:Z) ← \$ffff Erase Program memory page
- (ii) (RAMPZ:Z) ← R1:R0 Load Page Buffer
- (iii) (RAMPZ:Z) ← BUFFER Write Page Buffer to Program memory
- (iv) (RAMPZ:Z) ← \$fff, Z ← Z + 2 Erase Program memory page, Z post incremented
- (v) BLBITS ← R1:R0, Z ← Z + 2 Load Page Buffer, Z post incremented
- (vi) (RAMPZ:Z) ← BUFFER, Z ← Z + 2 Write Page Buffer to Program memory, Z post incremented

Syntax:

Operands:

Program Counter:

- (i)-(iii) SPM None PC ← PC + 1
- (iv)-(vi) SPM Z+ None PC ← PC + 1

118. ST – Store Indirect From Register to Data Space using Index X

118.1. Description

Stores one byte indirect from a register to data space. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

The data location is pointed to by the X (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64KB. To access another data segment in devices with more than 64KB data space, the RAMPX in register in the I/O area has to be changed.

The X-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for accessing arrays, tables, and Stack Pointer usage of the X-pointer Register. Note that only the low byte of the X-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPX Register in the I/O area is updated in parts with more than 64KB data space or more than 64KB Program memory, and the increment/ decrement is added to the entire 24-bit address on such devices.

Not all variants of this instruction is available in all devices. Refer to the device specific instruction set summary.

For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

120. ST (STD) – Store Indirect From Register to Data Space using Index Z

120.1. Description

Stores one byte indirect with or without displacement from a register to data space. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

The data location is pointed to by the Z (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64KB. To access another data segment in devices with more than 64KB data space, the RAMPZ in register in the I/O area has to be changed.

The Z-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for Stack Pointer usage of the Z-pointer Register, however because the Z-pointer Register can be used for indirect subroutine calls, indirect jumps and table look-up, it is often more convenient to use the X- or Y-pointer as a dedicated Stack Pointer. Note that only the low byte of the Z-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPZ Register in the I/O area is updated in parts with more than 64KB data space or more than 64KB Program memory, and the increment/decrement/displacement is added to the entire 24-bit address on such devices.

121. STS – Store Direct to Data Space

121.1. Description

Stores one byte from a Register to the data space. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

A 16-bit address must be supplied. Memory access is limited to the current data segment of 64KB. The STS instruction uses the RAMPD Register to access memory above 64KB. To access another data segment in devices with more than 64KB data space, the RAMPD in register in the I/O area has to be changed.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) $(k) \leftarrow Rr$

Syntax:

- (i) STS k,Rr

Operands:

- $0 \leq r \leq 31, 0 \leq k \leq 65535$

122. STS (16-bit) – Store Direct to Data Space

122.1. Description

Stores one byte from a Register to the data space. For parts with SRAM, the data space consists of the Register File, I/O memory, and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash memory has been mapped to the data space and can be written using this command. The EEPROM has a separate address space.

A 7-bit address must be supplied. The address given in the instruction is coded to a data space address as follows:

$$\text{ADDR}[7:0] = (\overline{\text{INST}}[8], \text{INST}[8], \text{INST}[10], \text{INST}[9], \text{INST}[3], \text{INST}[2], \text{INST}[1], \text{INST}[0])$$

Memory access is limited to the address range 0x40...0xbf of the data segment.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

2. Updated number of clock cycles column to include Reduced Core tinyAVR.

(ATtiny replaced by Reduced Core tinyAVR).

129.5. Rev.0856H – 04/2009

1. Updated section "[Instruction Set Summary](#)":

Updated number of clock cycles column to include Reduced Core tinyAVR.

2. Updated sections for Reduced Core tinyAVR compatibility:

Section "[CBI – Clear Bit in I/O Register](#)"

Section "[LD – Load Indirect from Data Space to Register using Index X](#)"

Section "[LD \(LDD\) – Load Indirect from Data Space to Register using Index Y](#)"

Section "[LD \(LDD\) – Load Indirect From Data Space to Register using Index Z](#)"

Section "RCALL – Relative Call to Subroutine"

Section "SBI – Set Bit in I/O Register"

Section "ST – Store Indirect From Register to Data Space using Index X"

Section "ST (STD) – Store Indirect From Register to Data Space using Index Y"

Section "ST (STD) – Store Indirect From Register to Data Space using Index Z"

3. Added sections for Reduced Core tinyAVR compatibility:

Section "LDS (16-bit) – Load Direct from Data Space"

Section "STS (16-bit) – Store Direct to Data Space"

129.6. Rev.0856G – 07/2008

1. Inserted "Datasheet Revision History".
2. Updated "Cycles XMEGA" for ST, by removing (iv).
3. Updated "SPM #2" opcodes.

129.7. Rev.0856F – 05/2008

1. This revision is based on the AVR Instruction Set 0856E-AVR-11/05.

Changes done compared to AVR Instruction Set 0856E-AVR-11/05:

- Updated "Complete Instruction Set Summary" with DES and SPM #2.
- Updated AVR Instruction Set with XMEGA Clock cycles and Instruction Description.
